Joseph Murphy

						25	Male	Systems Engineer	There is FlightAware (www.flightaware.com) that is similar but nothing to show you how likely the flight is to be delayed using historically data and current airport data. Also I would want a Money feature to determine cost of taking direct vs layoffs which input valuing time
Myself	Flight Calculator to find out delay percentages	None							

I want to do this topic because it is near and dear to me. I really enjoy traveling and I have to a lot for work as well. I have bought cheaper flights that had a layover in order to save money compared to a direct flight only to have the first leg of my flight delayed so then I missed the second leg and had to find the next flight from my layover to my end destination. I was stuck in my layover location and missed valuable time at my destination. Which ended up costing me more in the end. Also if this happened for a work trip it would cost my company valuable time and reputation and could cause them to lose sales and profit. So I believe something like this is very important so you can know the risk of an indirect flight vs a direct flight and make the decision based upon that.
